FOREWORD

This document has been prepared by Peter Baxter Associates Ltd with all reasonable skill, care and diligence within the terms of the contract with the Client and within the limitations of the resources devoted to it by agreement with the client.

This document is confidential to the Client and Peter Baxter Associates Ltd accepts no responsibility whatsoever to third parties to whom this document, or any part thereof, is made known. Any such party relies upon the document at their own risk.

This document shall not be used unless the document status is 'Final', and Peter Baxter Associates Ltd's fees have been settled in full.

Unless specifically assigned or transferred within the terms of the agreement, the consultant asserts and retains all Copyright, and other intellectual Property Rights in and over the Report and its contents.

1.0 SUMMARY

1.1 A steeply sloping undeveloped area of land approximately 3200m^2 in area, situated to the south of Romney Avenue, Folkestone, Kent CT20 3QJ (the Site), is to be developed with ten three storey houses arranged in four blocks.

1.2 Peter Baxter Associates (PBA) was commissioned by the Client; Village Homes Folkestone Ltd, to carry out a geotechnical site investigation and slope stability analysis. The investigation comprised the desk study of historical data, two boreholes to 15m depth, one borehole to 6m depth, three boreholes to 3m depth, and insitu testing and groundwater monitoring at each borehole location. Soil samples were tested for a range of geotechnical parameters, and three samples were tested for contamination levels. The objectives of the investigation were to obtain sufficient data for slope stability analysis, foundation, and retaining wall design. All boreholes were surveyed and related to ground levels with respect to Ordnance Datum.

1.3 This Site Investigation Report is revision 2.0 of a version dated 23rd October 2018. This report includes the presentation of the soil contamination results against generic Acceptance Criteria and the assessment of environmental risk, to address a planning query. This report describes the Site's geology, history, nearby mining and ground movement, field works, visual observations and laboratory testing, details and discusses the slope stability analyses, recommends a foundation type, retaining wall design parameters, and design sulphate class, and assesses the environmental risks associated with the Site.

1.4 The Site comprises a 1 in 1.5 10m high slope over two thirds of its area that is overgrown with trees. The remaining, western third had been temporarily levelled with loose fill during the investigation and will form the development area. Significant level changes will be required by the planned development. The Site had no history of development and there were no adjacent mining or quarrying operations. The western part of the Site was in a landslip area, but reported ground movements were low. No radon gas protection measures were required.

1.5 The site investigation described in this report was carried out between 20th September and 9th October. The Site's insitu soils comprised a medium dense orange grey clayey Sand to approximately 38m AOD over a dense grey clayey Sand below that level. These findings were consistent with the published geology. Placed fill was logged as a loose clayey Sand. Groundwater levels were found to

be relatively high and groundwater seepages were observed in the existing slope. No slope failures were observed.

1.6 The three categories of Site soils were treated as granular for the stability analyses. The soil strength parameters were derived from an empirical relationship between insitu test results and the internal angle of friction of the clayey sands. Effective strength parameters were used, with effective cohesion values of zero. The existing slope and existing fill were calculated to be stable but close to failure with factors of safety estimated as slightly greater than 1.

1.7 The fill must be stabilised before trafficking by heavy plant. Any excavations would require retaining structures. A bored pile or sheet pile retaining wall solution is recommended, which must be installed in advance of significant excavation. The design and analysis of such measures will depend on the final house and paving layout and levels, but a hypothetical study of a 1.5m high piled cantilever retaining wall indicated a satisfactory factor of safety greater than 1.5 for an 8m long 600mm diameter pile reinforced with 6 x 16mm reinforcing bars. Piled retaining walls are normally designed by specialist design and build piling contractors. Retaining wall design parameters are listed in Section 6.

1.8 It is recommended that the existing upper slope be monitored and the vegetation left in place and maintained, as the predicted failure mode would be shallow, and the tree roots would improve stability from that calculated. If this is unsatisfactory or found to be unsustainable, a soil nailing solution could be investigated. No construction on this upper slope will be possible.

1.9 Piled foundations are recommended for the house foundations. These would be designed by specialist piling contractors from the information presented in this report, but as an illustration a 300mm dimeter bored pile founding 12m below the current fill level is estimated to have a safe working load of 300kN. These bearing piles may also improve the slope stability and reduce the cost of piled retaining structures. Heave precautions are required for the ground floor slab and detailed in Section 6.

1.10 The recommended design sulphate class for concrete in contact with the soil is DS-2.

1.11 The environmental risks associated with the Site were assessed as low, verifying the conclusion of a separate Phase 1 Desk Study Report (Reference 1). The levels of contamination measured in the soils were below the limits of detection or

less than the adopted generic Acceptance Criteria for residential gardens with vegetable uptake. No remediation measures are considered necessary.

1.12 The expected waste category is "Inert" although leaching sulphate levels slightly exceed the minimum value.

2.0 SITE DESCRIPTION

2.1 Site Location and Description

2.1.1 The Site is a 3200m^2 undeveloped plot of land on the south side of Romney Avenue, Folkestone, Kent CT20 3QJ. The National Grid coordinates of the Site are 620610E, 136060N.

2.1.2 The Site comprises a steep wooded slope over approximately two thirds of its area. The remaining third, occupying the western part of the Site, was sloping but less steeply, and had been levelled with fill material in mid-2018. The main slope is some 10m high and slopes upwards to the east at approximately 1 in 1.5. The filled area is about 3m higher than its toe, and its western slope is 1 in 1.5. The steep slope contains badger sets, some of which were inhabited at the time of the investigation. There were no signs of slope instability observed during the investigation. Water seepages were observed in the slope just above the lower fill area.

2.1.3 The Site is shown on Figure 1, and photographs illustrating the Site are presented in Appendix E.

2.2 Proposed Development

2.2.1 It is proposed to develop the lower third of the Site with ten town houses in four blocks, with small gardens and off-street parking areas. The development will require excavation into the slope and retaining structures.

2.3 Site Investigation Objectives

2.3.1 The site investigation objectives were to confirm the Site geology, including groundwater conditions, to carry out slope stability analyses based on the investigation findings, to establish foundation and retaining wall design parameters, and to assess the environmental risks associated with the Site by comparing measured contamination levels with Acceptance Criteria.

2.3.2 Peter Baxter Associates (PBA) developed an investigation methodology that is detailed in Section 3. The methodology was constrained by the lack of drilling space at the top of the upper slope, the ecological constraint of the live badger's set, and the heavy undergrowth on the slope.

2.3.3 The field works, observations, and testing are detailed in Sections 3 and 4 of this report. The slope stability analysis is discussed in Section 5, and conclusions and interpretations presented in Section 7.

2.4 Published Geology

2.4.1 A desk study of the Site was carried out and is reported separately (Reference 1). Geological and historical maps and a Mining and Stability Report were obtained from Envirocheck. The geological map of the area indicated that the Site's natural geology is Folkestone Formation (Sandstone) over Sandgate Formation (sandstone, siltstone and mudstone). The western part of the Site was indicated as being within a landslip area. No made ground was indicated within 1000m of the Site. An area of Peat was shown approximately 20m west of the Site. Geological maps detailing the strata are presented in Appendix A1.

2.5 Published Geological Hazards and Radon

2.5.1 Reference 1 indicated a moderate risk of landslide, low risks of running sand, a very low risk of collapsible ground, and reported no hazards from compressible ground, ground dissolution, and shrinking and swelling clay.

2.5.2 The Site was in a lower probability radon area and no radon protection measures were reported necessary. The report from Public Health England, listing this assessment, is reproduced in Appendix A4.

2.6 Published History

2.6.1 Historical maps from Reference 1 are presented in Appendix A2. They indicated that the Site has remained undeveloped from 1873 to the present day. No quarries or artificially excavated faces were shown on the Site at any date. The houses on Eversley Way, whose gardens are at the top of the Site slope, were first shown on a 1957 map. Development of Romney Avenue dates from the early 1960s, and a block of flats bounding the Site to the west, Turner's Court, was shown on a 1978 map.

2.7 Published Mining and Ground Stability

2.7.1 The nearest recorded mining in Reference 1 was a quarry 785m north west of the Site. An area of infilled land was recorded 782m from the Site. Inconclusive coal mining was reported. Deep coal mining was conducted in the Folkestone area

from the early 20th century but the coal seams are hundreds of metres deep. The Mining and Ground Stability Report is included in Appendix A3.

2.7.2 Reference 1 contained ground movements around the Site measured by satellite radar techniques. These movements were all reported as -1mm per year or less. (Appendix A3).

3.0 FIELDWORK

3.1 Description of Field Works

3.1.1 Two boreholes denoted BH1 and BH2 were drilled to 15m depth using a cable percussion technique from the filled western area of the Site on 21st and 24th September 2018 by PBA's drilling contractor, South Eastern Drilling Services Ltd, Minster, Kent.

3.1.2 Four boreholes (WS1 to WS4) were drilled on 20th and 21st September using a window sampling rig by Siteserve Ltd, Canterbury. WS1 was drilled to 6m and WS2, WS3, and WS3 were drilled to 3m depth in the steep slope. Access for the window sample boreholes was prepared by an excavator provided by the Client.

3.1.3 Insitu testing was carried out at all borehole locations. All wells were fitted with groundwater monitoring installations. The works were carried out under the visiting supervision of a PBA geologist.

3.1.4 Recovered samples were logged by a PBA geologist and selected samples were tested. The borehole locations were surveyed to Ordnance Survey grid coordinates and levels by a Siteserve land surveyor.

3.1.5 The site investigation was carried out in accordance with BS5930 (Reference 2). The borehole locations are shown in Figure 1. The borehole logs are presented in Appendix B1.

3.2 Ground Conditions and Observations

3.2.1 The Site soils on the fill area comprised made ground of between 0.5m and 0.8m depth. Topsoil 0.45m in depth was found in WS1 but in no other borehole. The soils above a level of approximately 38m AOD comprised a medium dense orange brown silty Sand. Below that level was a dense dark grey silty Sand. The fill encountered in boreholes BH 1 and BH2 comprised a loose clayey Sand with rootlets in some samples. Some layers of sandy Clay were observed.

3.2.2 These observations were consistent with descriptions of the Folkestone Formation and Sandgate Formation shown on geological maps.

3.2.3 No signs or smells of contamination were observed in the soil samples recovered. Some loose rubbish was noted on the filled area.

3.2.4 Photographs of the recovered window sample cores recovered from WS1 to WS4 are presented in Appendix E.

3.3 Groundwater Conditions

3.3.1 Groundwater was encountered in boreholes BH1 and BH2, rising slowly to 2.5m depth in both boreholes (approximately 33 to 34 mAOD). Groundwater levels were measured on 9th October and groundwater levels ranging from 35.74m AOD in BH1 to 45.15m AOD in borehole WS1 were observed. These equilibrium groundwater levels are presented on Table 3. The weather during this period was dry. Groundwater seepages in the slope at approximately 37m AOD were observed.

3.4 Insitu Testing

3.4.1 Standard Penetration Test (SPT) testing was carried out in boreholes BH1 and BH2, at 1m intervals in the top 5m then at 2m intervals. The SPT N-values are summarised on Table 1 and presented on the borehole logs in Appendix B1, and ranged from N5 in the fill to N40+ at around 27m AOD (10m depth) in the dark grey silty Sand.

3.4.2 Super heavy dynamic probing tests (DPSH) were carried out adjacent to boreholes WS1 to WS4 to depths of 6m (7m at WS1) using a rig mounted tool. This tool comprises a 63.5kg weight falling 760mm, which drives a 50.5mm diameter cone into the ground via rods. The numbers of blows per 100mm of penetration are recorded. Plots of the DPSH values with depth are presented in Appendix B2. The number of blows recorded over 300mm are taken as equivalent to the Standard Penetration Test (SPT) values. Equivalent SPT values at each metre depth at each borehole were derived by inspection and are presented on Table 1.

3.5 Intrusive Environmental Investigation

3.5.1 Three soil samples were recovered from boreholes WS1, BH1, and BH2, from the fill material and natural ground. The samples were stored and transported in accordance with best practice guidelines. The sampling frequency of one sample per 330m^2 of developed land was in accordance with Reference 7.

3.5.2 The samples were tested for a range of contaminants recommended in the Desk Study. The test parameters were asbestos trace, soil organic matter, the "CLEA" suite of heavy metals, oils and selected volatile organic compounds (TPH-CWG) and polyaromatic hydrocarbons (PAH). The results of this testing are summarised on Table 6 and are their environmental implications discussed in Section 7.

4.0 LABORATORY TESTING

4.1 General

4.1.1 Geotechnical testing was carried out by Peter Baxter Associates Laboratories, Gillingham, Kent in accordance with BS 1377 (Reference 3). Contamination testing was carried out by DETS Ltd, Lenham, Kent. Geotechnical test results are summarised in Table 2. Contamination test results are summarised in Table 6.

4.2 Particle Size Distribution Testing

4.2.1 Seven samples, recovered from all boreholes at a range of depths, were tested for particle size distribution. The test reports are included in Appendix C1. The results indicated a clayey Sand becoming a silty Sand, with fines contents between 6% to 26%.

4.3 Atterberg Limits Testing

4.3.1 Eight samples, recovered from a range of depths from boreholes BH1, BH2, WS1 and WS3, WS2, were tested to determine natural moisture content and liquid and plastic limits. The test reports are included in Appendix C2. The plasticity indices ranged between 6% and 36%.

4.4 Sulphate and pH Testing

4.4.1 Water soluble sulphate and pH testing was carried out on six samples recovered from a range of depths from boreholes BH1, BH2, WS1 and WS3. The laboratory test report is included in Appendix C3 and indicates sulphate contents ranging from 0.0 to 0.5 g/l, indicating a design sulphate value of DS-2.

4.5 Loss on Ignition Testing

4.5.1 Loss on ignition testing was carried out on five samples recovered from boreholes BH1, BH2, WS1 and WS3. The laboratory test report is included in Appendix C4 and values range between 1.2% to 2.4%, indicating a low organic content in the samples tested.

4.6 Contamination Testing

4.6.1 Three soil samples recovered from shallow depths from borehole BH1, BH2, and WS1 were tested for the solid content of a range of potential contaminants; asbestos trace, a suite of heavy metals, polyaromatic hydrocarbons (PAH), total petroleum hydrocarbons (TPH), and selected volatile organic compounds. The

sample from BH1 was also tested for leaching potential to BSEN12457 (the "WAC Test"). The test reports are included in Appendix C5. The samples were stored and transported in accordance with best practice guidelines. The samples were recovered and tested for waste characterization purposes but have been compared in this Report with generic Acceptance Criteria to verify the level of environmental risk associated with the Site.

4.6.2 Contamination test results are summarised in Table 6. Asbestos was not detected. Levels of heavy metals were detected at levels below acceptance criteria in guidance or below the detection limit. Levels of TPH were lower than the selected Acceptance Criteria. Levels of volatile organic compounds were lower than detection limits. Levels of PAH compounds were detected at levels below acceptance criteria in guidance, or below the detection limit.

5.0 SLOPE STABILITY ASSESSMENTS

5.1 Soil Parameters

5.1.1 The soil parameters used in the analysis are summarised on Table 4. From laboratory testing and observations, the soils were regarded as granular for the purposes of the stability assessment. The soil's drained parameters were used in the stability assessment as being representative of the soil's long-term condition.

5.1.2 The drained shear strength parameters of the silty sand above 37.50m AOD, taken as being the Folkestone Formation, were derived from an empirical correlation between the effective angle of internal friction ϕ' and SPT values. An SPT N value of N30 was adopted from the results summarised on Table 1, giving a ϕ' value of 34^0. The effective cohesion was conservatively assumed to be zero.

5.1.3 The drained shear strength parameters of the insitu silty sand below 37.50m AOD, taken as being the Sandgate Formation, were derived from an empirical correlation between the effective angle of internal friction ϕ' and SPT values. An SPT N value of N40 was adopted from the results summarised on Table 1, giving a ϕ' value of 36^0. The effective cohesion was conservatively assumed to be zero.

5.1.4 The drained shear strength parameters of the loose sand fill were derived from an empirical correlation between the effective angle of internal friction ϕ' and SPT values. An SPT N value of N8 was adopted from the results summarised on Table 1, giving a ϕ' value of 30^0. The effective cohesion was conservatively assumed to be zero.

5.1.5 The bulk density of all soils was defined as 20kN/m^3, from literature. The groundwater table was derived from the groundwater level readings summarised in Table 3.

5.2 Slope Analysis Methodology

5.2.1 The analysis sections were derived from a Client's survey of March 2018, shown as the basis of Figure 1. The section line is shown on Figure 1. The slope stability analyses were carried out with GeoSlope software using Bishop's Method of Slices. For each section a large area was initially defined for the location of the slip circle centroid, which was then more closely defined to confirm a worst-case factor of safety. The output is summarised on Table 5, and plots from the analysis software are included in Appendix D.

5.2.2 Section 1-1 was an analysis of the pre-existing slope shown on the March 2018 survey. Sections 2-2 and 3-3 were an analysis of the current slope including the recent fill. Section 4-4 studied the effect of a 1 in 2 slope excavated to form a level platform at 33.25mAOD. Section 5-5 reviewed the effect of a 1.5m retaining wall.

5.3 Analysis Output

5.3.1 The factors of safety of each section are summarised on Table 5 along with a description of the failure mode. The graphical output from the final analysis on each section are presented in Appendix D.

5.3.2 The factor of safety of the previously existing slope Section 1-1 was calculated as 1.03 with a shallow failure on the upper slope. From the Site's history (Section 2.6) the slope is considered to be natural. No indications of slope failure were observed, and published ground movement was low, so it is considered a reasonable assumption that the slope is stable but close to failure, as implied by the calculated safety value of Section 1-1 that is slightly greater than unity.

5.3.3 The factor of safety of the current profile Section 2-2 was calculated as 1.08, with a shallow failure on the upper slope, as discussed in Section 5.3.2 above.

5.3.4 The factor of safety of the current fill profile Section 3-3 was calculated as 1.02 by examining different failure surface limits. This implies that the fill, the angle of which was assumed to be 1:1.5, is close to failure, with a relatively deep failure mode. Movement of heavy plant near the edge may be expected to destabilise the fill.

5.3.5 The factor of safety of a hypothetical excavation profile Section 4-4 (1:2 excavation to form a level platform at 33.25mAOD), was 0.89. This excavation profile would be unstable, suggesting that retaining measures will be required for the development.

5.3.6 The factor of safety of a hypothetical retained excavation profile Section 5-5 (1.5m retained height with a 1 in 7 slope in front of the 8m long piled retaining wall) was 1.62. This exceeds a factor of safety of 1.50 considered to be the minimum acceptable for permanent structures, suggesting that this retention solution would be stable. Other cases with the same section but shorter pile lengths were studied but indicated factors of safety less than 1.50. The factor of safety against shallow failures of the upper slope remained at 1.03.

6.0 ENVIRONMENTAL RISK ASSESSMENT

6.1 Summary of Desk Study Report

6.1.1 Reference 1 indicated that the Site geology was Sandgate Formation or Folkestone Formation sandstone, that the risks of landslide was moderate and other geological hazards were of low risk. The Site was within a low probability radon area and no protective measures were required. Geological maps are included in Appendix A1.

6.1.2 The Site was shown as undeveloped during its recorded history. The residential development above the Site's slope dated from 1957 and other neighbouring properties were completed by 1978. No significant sources of contamination within 1000m were indicated on the historical maps.

6.1.3 No areas of sensitive land use were within 1000m of the Site. The Site overlay a minor aquifer and the nearest surface water feature was 395m away.

6.1.4 Two mineral workings, no landfills, four permitted activities and 136 active and defunct trades were identified within 1000m of the Site. The closest trade, a dry cleaners, was at 121m distance.

6.1.5 No rubbish or signs of contamination were observed on the Site during a walkover survey in September 2018.

6.1.6 The environmental risks to on site receptors from on and off-site sources were assessed as low in the Desk Study Report. The environmental risks to off-site receptors including controlled waters from on-site sources were assessed as low in the Desk Study Report.

6.2 Acceptance Criteria

6.2.1 The generic Acceptance Criteria for the Site were derived from several sources; the LQM/CIEH S4UL levels for human health risk assessment (Reference 8), "Category Four Screening Levels" (C4SL) limits (Reference 9) and Dutch guidelines for soil contamination (Reference 10). The S4UL and C4SL levels given for residential land use with vegetable uptake were adopted along with the "Intervention Levels" from the Dutch guidelines. The Soil Organic Matter content was assumed to be 1%. The adopted Acceptance Criteria are given in Table 6, shaded in yellow.

6.2.2 The lowest Acceptance Criteria were generally adopted when contaminants had varying criteria from multiple sources.

6.3 Contamination Test Results

6.3.1 The contamination test report is included in Appendix C5 and the results summarised in Table 6. Asbestos was not detected. Levels of heavy metals were detected at levels below acceptance criteria in guidance or below the detection limit. Levels of TPH were lower than the selected Acceptance Criteria. Levels of volatile organic compounds were lower than detection limits. Levels of PAH compounds were detected at levels below acceptance criteria in guidance, or below the detection limit.

6.3.2 The loss on ignition test results discussed in Section 4.5 and included in Appendix C4 indicated low levels of organic matter. Ground gas generation from on site soils was therefore considered unlikely.

6.3.3 A sample from BH1 was tested for leaching potential to BSEN12457 (the "WAC Test"). The report is included in Appendix C5 and shows low levels of leaching contaminants.

6.4 Generic Environmental Risk Assessment

6.4.1 A generic environmental risk assessment based on the results discussed above and the recommendations of Reference 6 is presented in Table 7 and concluded that the environmental risk to the off-site receptors groundwater and surface water from on Site sources was low. The measured concentrations of contaminants in the soil were below the Acceptance Criteria.

7.0 CONCLUSIONS AND RECOMMENDATIONS

7.1 Slope Stability Conclusions

7.1.1 The existing upper slope is considered to be stable but close to failure. The expected failure mode is a shallow slip or translational failure. The existing trees and vegetation are expected to improve the slope stability from the values presented in Table 5, and it is recommended that these are left in place, with larger trees maintained and trimmed on an ongoing basis as necessary. The slope should be visually monitored over a period of years to confirm stability and failure modes. No construction on this upper slope will be possible. If further stability measures are required, or if the slope is not sustainable, a soil nailing solution may be investigated. This would require the clearance of most of the existing trees, which may raise aesthetic, ecological, and neighbor relation issues.

7.1.2 The fill is considered to be stable but close to failure. The toe of the fill slope must be stabilized or the current 1 in 1.5 slope reduced before the use of heavy plant, such as piling rigs, is permitted.

7.1.3 Excavations must be retained by retaining measures designed by a competent organization or individual. The soil strength values summarised on Table 4 and a minimum factor of safety of 1.50 are recommended. It is recommended that bored pile retaining walls or sheet piled retaining walls be installed prior to excavation. The study of a hypothetical 1.5m deep excavation indicated that a 600mm diameter 8m deep bored pile wall at 750mm centres, reinforced with 6 x T16 reinforcement will provide a satisfactory factor of safety. Any design solution must account for the final maximum retained height, and may incorporate a suitably designed slab as a prop. Such solutions are typically designed by piling contractors as part of a design and build package.

7.2 Recommended Foundation Type and Design Parameters

7.2.1 Piled foundations are recommended for the new houses. Shallow strip footings are not considered to be viable and deep trench foundations could create slope stability problems during construction. Suitably reinforced bearing piles would also improve the factor of safety against slope failure from that discussed in Section 6.1.3, potentially reducing the cost of a piled retaining wall. Piles are generally designed by a piling contractor, but as an illustration, a 300mm diameter bored pile, drilled to a depth of 12m from the current fill level, estimated to have a safe working load of 300 kN.

7.2.2 If treated as a sandy Clay, the soils between 45m AOD and 31m AOD are considered to be of low volume potential. The planned north western houses in particular may be within the zone of influence of nearby or removed trees (Reference 5). If the floor slabs are not suspended, with a void dimension of at least 125mm, a void former of Celotex or similar with a void dimension of 50mm is recommended. Such void formers are also recommended for the underside of ground beams.

7.3 Recommended Design Sulphate Class

7.3.1 The soil sulphate tests discussed in Section 4.4 and reported in Appendix C3 measured sulphate contents ranging from 0.1 to 0.5g/l. A design sulphate value of DS-2 is therefore recommended for all concrete in contact with the ground. (Reference 4).

7.4 Environmental Risk and Assessed Waste Category

7.4.1 A Phase 1 Desk Study (Reference 1) concluded that the environmental risks associated with the Site were low. Soil contamination testing discussed in Section 4.6 and reported in Appendix C5 carried out on samples recovered from the Site for the purpose of waste characterization, indicated that the measured contamination levels were less than the adopted Acceptance criteria, and so confirmed that the environmental risks associated with the Site were low. No environmental remediation measures are considered necessary.

7.4.2 The contamination tests indicate no contamination, and the leaching test indicates compliance with the inert waste criteria, with the exception of sulphate. Any waste timber or buried debris discovered should be separated and disposed of separately.

TABLE 7

Conceptual Model and Generic Environmental Risk Assessment

Source	Pathway	Receptor	Assessed Environmental Risk
On site contaminants from previous site use and placed fill.	Vegetable uptake, ingestion, inhalation of dust and vapours and dermal contact	Future occupants	Low. The former uses were considered low risk, the fill was sourced from adjacent natural ground, and levels of measured contamination were less than the adopted generic Acceptance Criteria
On site contaminants: as above	Infiltration, airborne dust	Surface Water and ecological systems	Low. The uses were considered low risk and the receptors are far from the Site.
On site contaminants: as above	Leaching into groundwater	Groundwater	Low. The Site overlies a minor aquifer but levels of measured contamination were less than the adopted generic Acceptance Criteria
Offsite contaminants Migrating gases and vapours from nearby sources	Inhalation of dust gases and vapours	Human occupants of the site	Low. No sources were identified within 1000m

Geology 1:10,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:10,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around a site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page.

Please Note: Not all of the layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

LANDMARK INFORMATION GROUP®

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

LANDMARK INFORMATION GROUP®

Superficial Geology

BGS 1:10,000 Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

LANDMARK INFORMATION GROUP®

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults and thin beds mapped as lines such as coal seams and mineral veins. These are not restricted by age and could relate to features of any of the 1:10,000 geology datasets.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:10,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Published 1899

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Kent

Published 1873

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1973

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m
Mining and Natural Cavities Data					
BGS Recorded Mineral Sites	pg 1				2
Coal Mining Affected Areas			n/a	n/a	n/a
Man Made Mining Cavities					
Mining Instability	pg 1	Yes	n/a	n/a	n/a
Natural Cavities					
Non Coal Mining Areas of Great Britain	pg 1	Yes		n/a	n/a
Potential Mining Areas					
Historical Land Use Information (1:2,500)					
Extractive Industries or Potential Excavations from 1855-1909 (100m)				n/a	n/a
Extractive Industries or Potential Excavations from 1893-1915 (100m)				n/a	n/a
Extractive Industries or Potential Excavations from 1906-1937 (100m)				n/a	n/a
Extractive Industries or Potential Excavations from 1924-1949 (100m)				n/a	n/a
Extractive Industries or Potential Excavations from 1950-1980 (100m)				n/a	n/a
Subterranean Features (100m)				n/a	n/a
Historical Land Use Information (1:10,000)					
Air Shafts					
Disturbed Ground					
General Quarrying					
Heap, unknown constituents					
Mineral Railway					
Mining & quarrying general					
Mining of coal & lignite					
Quarrying of sand & clay, operation of sand & gravel pits	pg 2				2
Former Marshes					
Potentially Infilled Land (Non-Water)	pg 2				2
Potentially Infilled Land (Water)	pg 2				1

APPENDIX A4
Radon Report

Public Health England

Report of address search for radon risk

British Geological Survey
NATURAL ENVIRONMENT RESEARCH COUNCIL

Radon Risk Report for addresses in England and Wales

Address searched: 16 Romney Avenue, Folkestone, CT203QJ
Date of report: 24 October 2018

Guidance for existing properties

Is this property in a radon Affected Area? - No

A radon Affected Area is defined as where the radon level in at least one property in every hundred is estimated to exceed the Action Level.

The estimated probability of the property being above the Action Level for radon is: 0-1%

The result may not be valid for buildings larger than 25 metres.
If this site if for redevelopment, you should undertake a GeoReport provided by the British Geological Survey.

This report informs you of the estimated probability that this particular property is above the Action Level for radon. This does not necessarily mean there is a radon problem in the property; the only way to find out whether it is above or below the Action Level is to carry out a radon measurement in an existing property.

Radon Affected Areas are designated by the Public Health England. PHE advises that radon gas should be measured in all properties within Radon Affected Areas.

If you are buying a currently occupied property in a Radon Affected Area, you should ask the present owner whether radon levels have been measured in the property. If they have, ask whether the results were above the Radon Action Level and if so, whether remedial measures were installed, radon levels were re-tested, and the results of re-testing confirmed the effectiveness of the measures.

Further information is available from PHE or https://www.ukradon.org

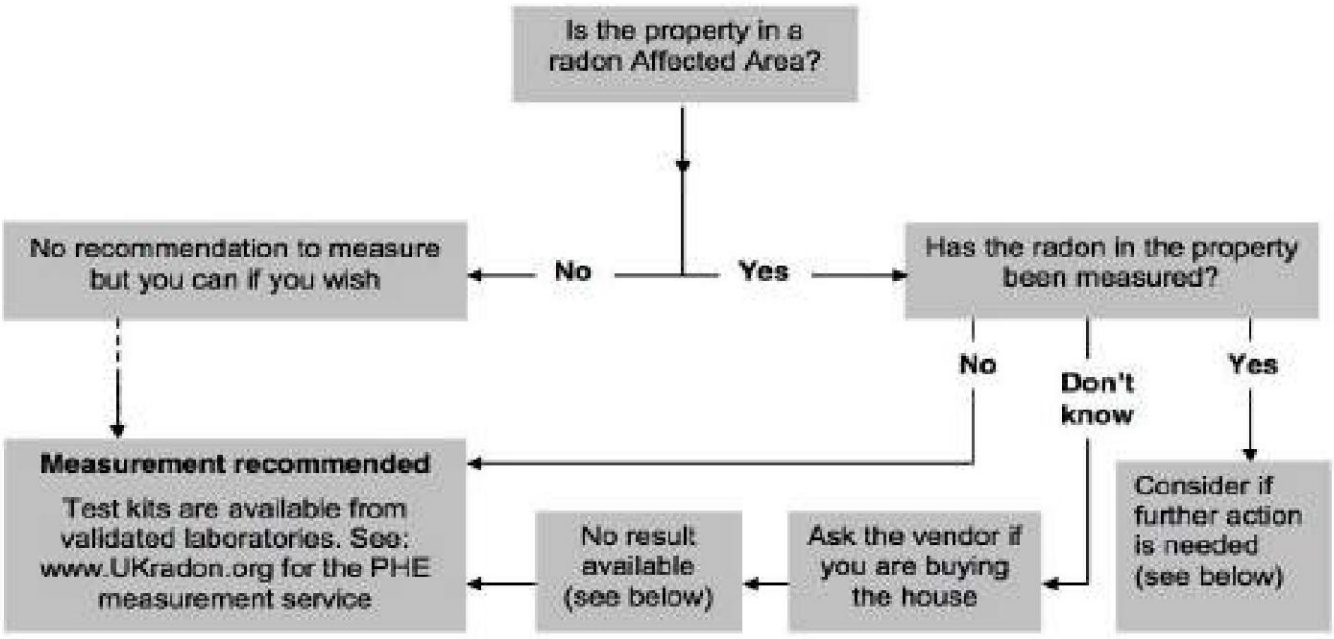
Guidance for new buildings and extensions to existing properties

What is the requirement under Building Regulations for radon protection in new buildings and extensions at the property location? - None

If you are buying a new property in a Radon Affected Area, you should ask the builder whether radon protective measures were incorporated in the construction of the property.

See the Radon and Building Regulations for more details.

PHE guidance for occupiers and prospective purchases



Existing radon test results: There is no public record of individual radon measurements. Results of previous tests can only be obtained from the seller. Radon levels can be significantly affected by changes to the building or its use, particularly by alterations to the heating and ventilation which can also be affected by changes in occupier. If in doubt, test again for reassurance.

Radon Bond: This is simply a retained fund, the terms of which are negotiated between the purchaser and the vendor. It allows the conveyance of the property to proceed without undue delay. The purchaser is protected against the possible cost of radon reduction work and the seller does not lose sale proceeds if the result is low. Make sure the agreement allows enough time to complete the test, get the result and arrange the work if needed.

High Results: Exposure to high levels of radon increases the risk of developing lung cancer. If a test in a home gives a result at or above the Action Level of 200 Becquerels per cubic metre of air (Bq/m3), formal advice will be given to lower the level. Radon reduction will also be recommended if the occupants include smokers or ex-smokers when the radon level is at or above the Target Level of 100 Bq/m3; these groups have a higher risk. Information on health risks and radon reduction work is available from PHE. Guidance about radon reduction work is also available from some Local Authorities, the Building Research Establishment and specialist contractors.

PHE designated radon website: https://www.ukradon.org
Building Research Establishment: http://www.bre.co.uk/page.jsp?id=3137

Matrix	Analysed On	Determinand	Brief Method Description	Method No
Soil	D	Boron - Water Soluble	Determination of water soluble boron in soil by 2:1 hot water extract followed by ICP-OES	E012
Soil	AR	BTEX	Determination of BTEX by headspace GC-MS	E001
Soil	D	Cations	Determination of cations in soil by aqua-regia digestion followed by ICP-OES	E002
Soil	D	Chloride - Water Soluble (2:1)	Determination of chloride by extraction with water & analysed by ion chromatography	E009
Soil	AR	Chromium - Hexavalent	Determination of hexavalent chromium in soil by extraction in water then by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry	E016
Soil	AR	Cyanide - Complex	Determination of complex cyanide by distillation followed by colorimetry	E015
Soil	AR	Cyanide - Free	Determination of free cyanide by distillation followed by colorimetry	E015
Soil	AR	Cyanide - Total	Determination of total cyanide by distillation followed by colorimetry	E015
Soil	D	Cyclohexane Extractable Matter (CEM)	Gravimetrically determined through extraction with cyclohexane	E011
Soil	AR	Diesel Range Organics (C10 - C24)	Determination of hexane/acetone extractable hydrocarbons by GC-FID	E004
Soil	AR	Electrical Conductivity	Determination of electrical conductivity by addition of saturated calcium sulphate followed by electrometric measurement	E022
Soil	AR	Electrical Conductivity	Determination of electrical conductivity by addition of water followed by electrometric measurement	E023
Soil	D	Elemental Sulphur	Determination of elemental sulphur by solvent extraction followed by GC-MS	E020
Soil	AR	EPH (C10 – C40)	Determination of acetone/hexane extractable hydrocarbons by GC-FID	E004
Soil	AR	EPH Product ID	Determination of acetone/hexane extractable hydrocarbons by GC-FID	E004
Soil	AR	EPH TEXAS (C6-C8, C8-C10, C10-C12, C12-C16, C16-C21, C21-C40)	Determination of acetone/hexane extractable hydrocarbons by GC-FID for C8 to C40. C6 to C8 by headspace GC-MS	E004
Soil	D	Fluoride - Water Soluble	Determination of Fluoride by extraction with water & analysed by ion chromatography	E009
Soil	D	FOC (Fraction Organic Carbon)	Determination of fraction of organic carbon by oxidising with potassium dichromate followed by titration with iron (II) sulphate	E010
Soil	D	Loss on Ignition @ 450oC	Determination of loss on ignition in soil by gravimetrically with the sample being ignited in a muffle furnace	E019
Soil	D	Magnesium - Water Soluble	Determination of water soluble magnesium by extraction with water followed by ICP-OES	E025
Soil	D	Metals	Determination of metals by aqua-regia digestion followed by ICP-OES	E002
Soil	AR	Mineral Oil (C10 - C40)	Determination of hexane/acetone extractable hydrocarbons by GC-FID fractionating with SPE cartridge	E004
Soil	AR	Moisture Content	Moisture content; determined gravimetrically	E003
Soil	D	Nitrate - Water Soluble (2:1)	Determination of nitrate by extraction with water & analysed by ion chromatography	E009
Soil	D	Organic Matter	Determination of organic matter by oxidising with potassium dichromate followed by titration with iron (II) sulphate	E010
Soil	AR	PAH - Speciated (EPA 16)	Determination of PAH compounds by extraction in acetone and hexane followed by GC-MS with the use of surrogate and internal standards	E005
Soil	AR	PCB - 7 Congeners	Determination of PCB by extraction with acetone and hexane followed by GC-MS	E008
Soil	D	Petroleum Ether Extract (PEE)	Gravimetrically determined through extraction with petroleum ether	E011
Soil	AR	pH	Determination of pH by addition of water followed by electrometric measurement	E007
Soil	AR	Phenols - Total (monohydric)	Determination of phenols by distillation followed by colorimetry	E021
Soil	D	Phosphate - Water Soluble (2:1)	Determination of phosphate by extraction with water & analysed by ion chromatography	E009
Soil	D	Sulphate (as SO4) - Total	Determination of total sulphate by extraction with 10% HCl followed by ICP-OES	E013
Soil	D	Sulphate (as SO4) - Water Soluble (2:1)	Determination of sulphate by extraction with water & analysed by ion chromatography	E009
Soil	D	Sulphate (as SO4) - Water Soluble (2:1)	Determination of water soluble sulphate by extraction with water followed by ICP-OES	E014
Soil	AR	Sulphide	Determination of sulphide by distillation followed by colorimetry	E018
Soil	D	Sulphur - Total	Determination of total sulphur by extraction with aqua-regia followed by ICP-OES	E024
Soil	AR	SVOC	Determination of semi-volatile organic compounds by extraction in acetone and hexane followed by GC-MS	E006
Soil	AR	Thiocyanate (as SCN)	Determination of thiocyanate by extraction in caustic soda followed by acidification followed by addition of ferric nitrate followed by colorimetry	E017
Soil	D	Toluene Extractable Matter (TEM)	Gravimetrically determined through extraction with toluene	E011
Soil	D	Total Organic Carbon (TOC)	Determination of organic matter by oxidising with potassium dichromate followed by titration with iron (II) sulphate	E010
Soil	AR	TPH CWG (ali: C5- C6, C6-C8, C8-C10, C10-C12, C12-C16, C16-C21, C21-C34, aro: C5-C7, C7-C8, C8-C10, C10-C12, C12-C16, C16-C21, C21-C35)	Determination of hexane/acetone extractable hydrocarbons by GC-FID fractionating with SPE cartridge for C8 to C35. C5 to C8 by headspace GC-MS	E004
Soil	AR	TPH LQM (ali: C5-C6, C6-C8, C8-C10, C10-C12, C12-C16, C16-C35, C35-C44, aro: C5-C7, C7-C8, C8-C10, C10-C12, C12-C16, C16-C21, C21-C35, C35-C44)	Determination of hexane/acetone extractable hydrocarbons by GC-FID fractionating with SPE cartridge for C8 to C44. C5 to C8 by headspace GC-MS	E004
Soil	AR	VOCs	Determination of volatile organic compounds by headspace GC-MS	E001
Soil	AR	VPH (C6-C8 & C8-C10)	Determination of hydrocarbons C6-C8 by headspace GC-MS & C8-C10 by GC-FID	E001
